# Cable Tie Tool, Driver Type

The cable tie tool, driver type, is used to attach the INTREPID™ MicroPoint™ MC115 or MC315 cable to various types of fencing materials.

Used in conjunction with the stainless steel cable tie (21A46106), that wraps around the MC115 or MC315 cable and the fencing fabric, holding it firmly in place.

1. Place the stainless steel tie around the cable to be fastened.
2. Pull the tip through the locking head and hand tighten firmly to the material.
3. Slide the edge of the tip of the tie into the slot located at the end of the tool shaft.
4. Rotate the tool so that the tie tip goes down toward and under the remaining excess tie.
5. Continue to turn the tie into a coil until you have reached the desired amount of tension.
6. While releasing pressure from the coil, slide the tool out of the center of the coil.

NOTE: The coil may be cut off after tensioning if a lower profile is necessary. However, after cut-off, a sharp edge will remain.
